BASE THICKNESS CHART* (GENERAL)

APPLICATION	GRAVEL BASE	BEDDING COURSE
Patios, Walkways, Pool Decks	4"- 6"	1"-1.5 "
Driveways	6"-12"	1"-1.5 "
Steps, Planters, Raised Patios	6"	0-1/8 "

***Soil Conditions** - When working in areas where there are poor soil conditions (eg. heavy clay, disturbed soils) there is potential for deformation or settlement. Increase the depth of the base to provide more stability. Remove any loose or disturbed soils.

RESOURCE GUIDE

Step 1 BASE PREPARATION

Begin by marking out the area to be excavated. Excavating removes loose top soil or fill and allows for the placement of a compacted gravel base. Always excavate the area slightly wider to allow extra room.

In clay soils we strongly recommend using a geotextile material to keep soil and gravel apart. This will provide improved drainage and yield greater, long term stability.

Fill the area with the correct amount of gravel (see "Base Thickness Chart"). Grade your base material as closely as possible to the final contour of your patio, walkway or driveway surface. Remember to slope all installations away from the house for proper drainage.

Step 2 COMPACTING THE GRAVEL BASE

The base preparation is the most important part of the entire installation process. Appropriate base material, thickness, and compaction are essential to ensure your installation will last a lifetime. Use either a hand tamper or plate compactor and firmly compact the gravel base material. For best compaction, compact in 4" layers.

Step 3 SCREEDING

Pavers are laid on a bed of coarse sand. This bed should be 1" to 1-1/2" thick, no more, and is placed directly on top of the compacted base material. Using screed guides (1" to 1-1/2" in diameter) placed on the base, level the sand evenly by pulling a straight board along the guides. Once you've completed an area, remove the guides, fill in the grooves, and continue screeding.

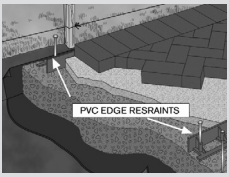
Step 4 LAYING & CUTTING THE PAVERS

Begin placing the pavers directly on the screeded bed of sand. Start laying along the longest straight side of the area to keep lines straight. This will minimize the amount of cutting required. It is important that the lines of your pavers are square, 90° to each other, to fit properly.

If you are installing circles, fans, or a soldier course (a border of pavers around the perimeter of the area) you will want to place these first before installing the rest of the pattern.

You may need to cut pavers that don't fit along edges or around objects. Mark the pavers and cut with either a guillotine cutter or masonry saw.

A guillotine cutter is the easiest method of cutting but for an exact cut, a masonry saw works best.



Tip

Edge restraints are a critical element to the durability of a paver installation. They prevent the pavers from moving and shifting over time. If you are using PVC edge restraint or similar, it should be installed after all pavers are in place.

Step 5 INSTALLING EDGE RESTRAINTS

It is important that the edging be installed on the compacted gravel base, not on the screeded sand layer. Carefully remove sand from edge of pavers. Place plastic edging against pavers and spike into the ground at approximately 1 foot intervals. (Holes are predrilled in edging.) Use 10" non-galvanized common spikes. These spikes will corrode and become locked into soil.

Step 6 COMPACTING THE PAVERS

After the installation is complete, including edge restraints, the pavers must be swept clean and then compacted with a plate compactor. This helps settle the pavers into the bedding sand and creates a smooth, flat surface.

Step 7 POLYMERIC SAND

Sweeping Polymeric Sand into the joints of the pavers further locks the pavers together. Continue to run the plate compactor over the pavers adding sand and compacting until the joints are full. This will help the sand settle deep into the joints. Please follow manufacturer's instructions for setting Polymeric Sand.

ICPI INTERLOCKING CONCRETE PAVEMENT INSTITUTE ®

Patio Stones Installation

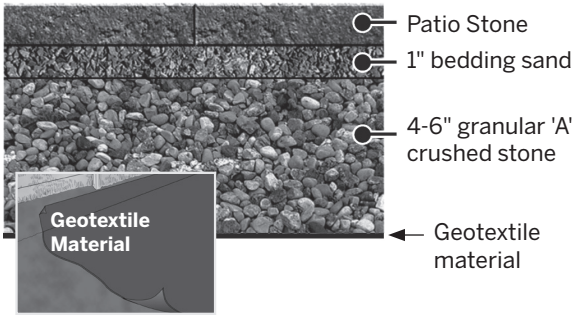
SUPPLIES

- Chisel
- Mallet
- Level
- Shovel
- Stakes & String
- Sand
- Patio Edge Restraint
- Safety Glasses/ Gloves
- Tamper
- Broom
- Granular “A” Crushed Stone

Patio Stones are easy to install for patios, pool surrounds and walkways.

Step 1	Mark the proposed area for excavation. In general excavate the area to an approximate depth of 4"-6".
Step 2	Fill excavated area with approximately 4" of granular “A” crushed stone.
Step 3	Compact crushed stone with a vibrating plate tamper. This will provide a firm base and allow water to drain.
Step 4	In clay soils we strongly recommend using a geotextile material to keep soil and gravel apart. This will provide improved drainage and yield greater, long term stability. Complete the base by adding 1" of bedding sand to achieve a smooth working area. Try to achieve a 2" slope approximately every 10 feet away from the foundation to assist with water drainage.
Step 5	Lay 1 to 2 rows of Patio Stones. Check the grade with a level to ensure proper drainage. Continue laying Patio Stones in the desired pattern.

Cross Section



Note: Patio Stones are recommended for pedestrian traffic only.

Garden Wall Installation

SUPPLIES

- Chisel
- Mallet
- Shovel
- Gloves
- Wheelbarrow
- Carpenter's Level
- Stakes & String
- Concrete Adhesive
- Tape Measure
- Safety Glasses
- Gravel

Install your garden wall in a few simple steps. Determine the square feet of your garden wall, then calculate the number of units required to complete your project.

Step 1 BASE PREPARATION

Once you have drawn up plans and marked off the site of your garden wall project, dig a trench at least 8" deep by 16" wide by the desired length. Compact gravel in the trench and fill to a depth of 6" to withstand loading on the surface and seasonal frost from below.

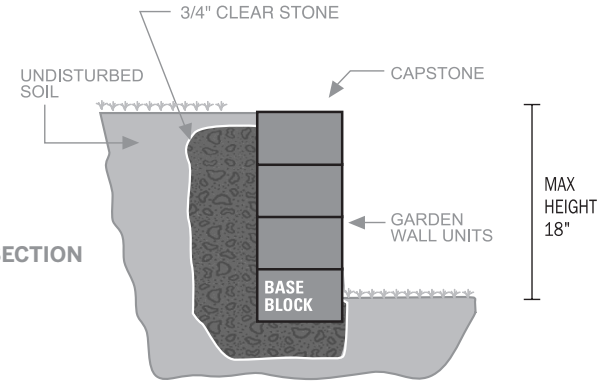
Step 2 THE FIRST ROW

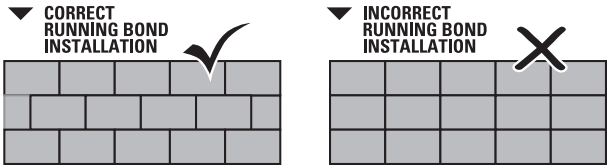
Lay the first level of blocks on the completed gravel base, making sure the units are level from side to side and front to back. Bury half of the base block.

Step 3 ADDITIONAL ROWS

Stack additional rows by staggering the units along the wall to your desired height. Apply adhesive on the last course to adhere to **CAPSTONES**. Then fill your garden wall or planter with soil.

GARDEN WALL CROSS SECTION





Useful Information

Installing Interlocking Pavers - colour tip

The colour in concrete pavers varies slightly from batch to batch and run to run. With blended colours, it is extremely important to follow the directions below.

When laying any paver job—big or small—draw your pavers vertically by section off the pallets, not horizontally row-by-row from the top. If your job requires multiple pallets, ensure that you draw from as many pallets as practical—but at least two or three—as you lay your pavers.

This practice will ensure that you get the best spread and mix of colours throughout your project. Remember, no two pavers are exactly the same!

Efflorescence

Efflorescence is a whitish powder-like deposit which sometimes appears on concrete products. The deposit is the residue of a soluble salt carried to the face of the product by moisture and left on the surface as dry powder following evaporation of the moisture.

Efflorescence in and of itself in no way affects structural integrity. It will usually wash and wear off in the course of time. The recommended procedure is to allow this natural process to take place. No responsibility can be accepted by the product manufacturer for efflorescence, since any normal concrete contains calcium hydroxide, which forms inevitably when cement and/or lime and water are mixed together.
